

Integration Tests Results:

Tester: Kyle Gould

1. Integration test for the entries and comment function to verify that comments can be made for specific entries and will load with those entries.

Results: Users can post comments that will properly load with their entries; however, we have found a bug that causes the webpage to become a blank page when the user submits their comments. The comments will still be properly posted. This bug has been resolved.

2. Integration test for how the search class works with the shelter entries. This test will examine how different searches interact with the dog entries table and shelter entries table.

Results: The search class works fine if you search using a shelters name, but does not seem to work at all if you try to search by city. This has since been resolved.

Search for: **Shelter** Search by: **Name**

Search Term: **Search**

3. Integration test for how the login, signup, and user classes all work together. This test will verify that users can create an account that is either a normal account, administrator account, or moderator account and then login with that account.

Results: The bug that caused new users to be unable to log in has been solved and users can now create normal accounts. Administrators are the only users who can give normal accounts moderator or administrator privileges.

- Integration test for how the user request class and the administrators approve and deny function works together. This test will verify that users can make requests for new entries which can then be approved or denied by administrators.

Results: The ability for normal users to submit requests for new entries has not been implemented yet, although administrators can still create new entries. As an administrator, I was able to create a new entry for the Chinook breed and the entry was successfully added to the database immediately.

System Tests Results:

Tester: Chris Santos

- Successfully able to request a new Dog entry from any user account. Successfully able to approve that request from an Admin account.
- Successfully able to add a new entry to the database from an admin account. Successfully able to add a new comment to a dog entry from a user account. Successfully able to delete comments from moderator account.

Black Box Testing:

Tester: Chris Santos

1. After testing the register and login functionality of the website, it initially resulted in an error. This bug has been fixed and it now successfully allows the creation of a new user, and correctly prevents a user from creating a new account with a username already being used.
2. After testing the search functionality of the website, the site correctly displayed entries when they were searched for. It also correctly displayed nothing when an invalid search term was used.
3. After testing the add entry functionality for admins, it initially resulted in an error. This error has been fixed, it now successfully adds the entry, and the entry can be found using the search functionality.

Grey Box Testing

Tester: Siyi Yu

1. Testing entry table to verify that new entries can be properly added and stored in the most efficient manner. We will do this by creating new dog entries and viewing how they are stored in the entries table.

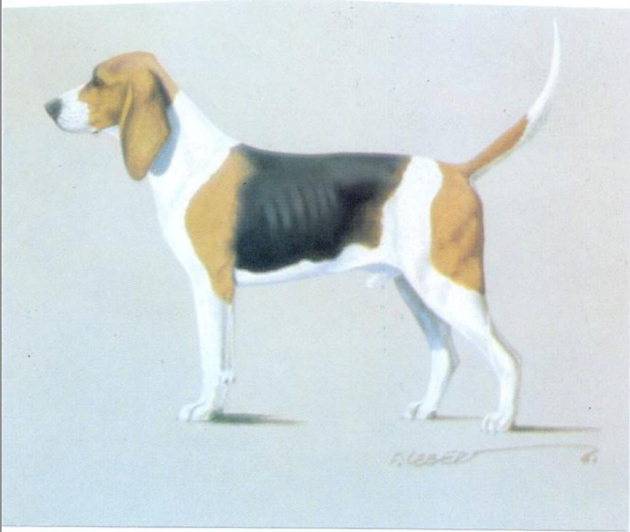

- Add new entry named “Grey box Test” into dog breeds table

```
INSERT INTO `breed` (`id`, `name`, `type`, `country`, `image`) VALUES (NULL, 'Greybox Test', 'test', 'test', 'http://www.fci.be/Nomenclature/Illustrations/028g06.jpg');
```

White Box Testing

Tester: Kyle Gould

Results: Started by performing a blank search for all categories of the search function to verify that this would load all of the results in those specific tables. The search function properly loaded all entries in the tables being called.

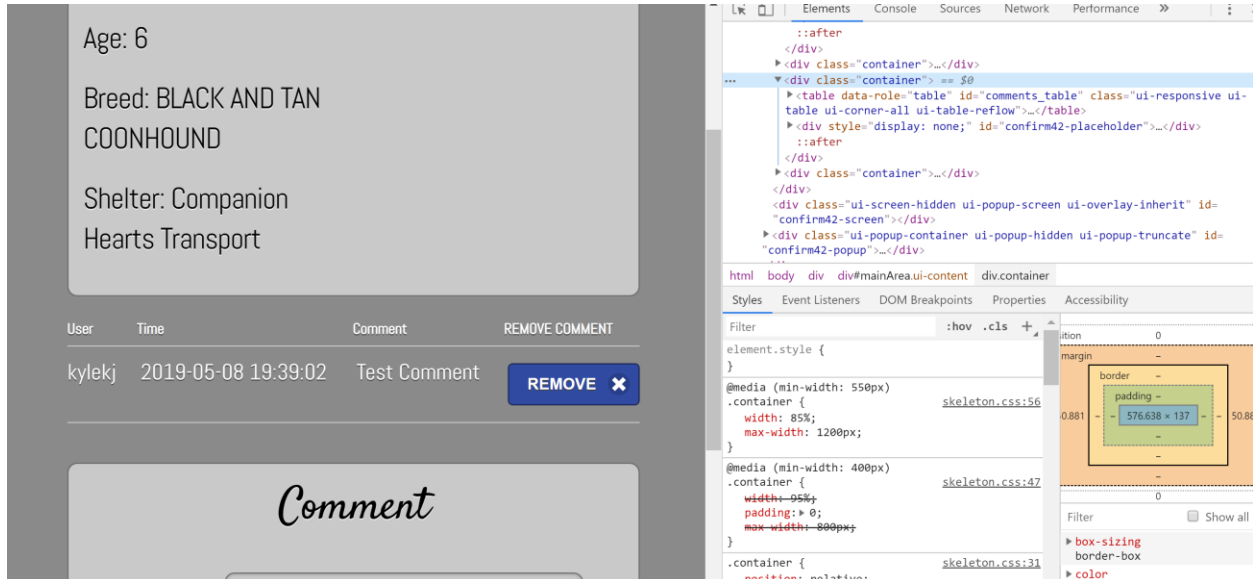

Next, I searched for the dog breed ‘Australian Terrier’ to ensure the search engine would load that entry and not entries that did not match with my search criteria. The search function worked properly and only displayed the entry I had searched for.

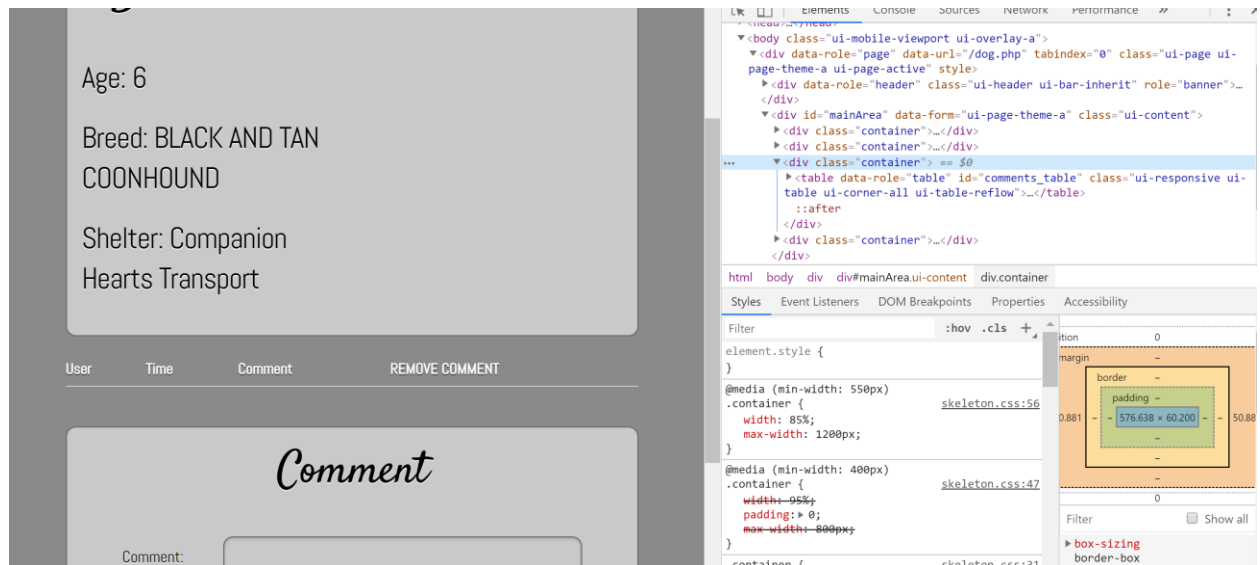

2. We will test the moderator's ability to delete comments and that deleted comments are properly removed from the comments table and are no longer linked to their entry.

Results: Logged in as a user with moderator privileges and added a comment to a dog entry and then removed it. The comment was properly added and properly deleted.

3. We will test the administrator's ability to add new entries and verify that those entries are properly stored in the entries table and are accounted for in searches.

Results: Logged in as a user with administrator privileges, added a new entry then searched for it. The entry was properly added and showed up when it was searched for.

The screenshot shows the 'Add Breed' form in a web application. The form has a title 'Add Breed' and four input fields: Name (Bernese Mountain Dog), Section (Breed), Country (Switzerland), and Image Link (http://www.fci.be/Nomenclature/illustrations/045g02.jpg). A blue 'Submit' button is at the bottom right. The form is part of a larger application with a navigation bar at the top containing 'Add Entries' and 'User Management'.
